## Features

- Utilizes the AVR ${ }^{\circledR}$ RISC Architecture
- AVR - High-performance and Low-power RISC Architecture
- 118 Powerful Instructions - Most Single Clock Cycle Execution
- $32 \times 8$ General-purpose Working Registers
- Up to 10 MIPS Throughput at 10 MHz
- Data and Nonvolatile Program Memory
- 2K Bytes of In-System Programmable Flash

Endurance: 1,000 Write/Erase Cycles

- 128 Bytes Internal RAM
- 128 Bytes of In-System Programmable EEPROM

Endurance: 100,000 Write/Erase Cycles

- Programming Lock for Flash Program and EEPROM Data Security
- Peripheral Features
- One 8-bit Timer/Counter with Separate Prescaler
- Programmable Watchdog Timer with On-chip Oscillator
- SPI Serial Interface for In-System Programming
- Special Microcontroller Features
- Low-power Idle and Power-down Modes
- External and Internal Interrupt Sources
- Power-on Reset Circuit
- Selectable On-chip RC Oscillator
- Specifications
- Low-power, High-speed CMOS Process Technology
- Fully Static Operation
- Power Consumption at $4 \mathrm{MHz}, \mathbf{3 V}, 5^{\circ} \mathrm{C}$
- Active: 2.4 mA
- Idle Mode: 0.5 mA
- Power-down Mode: <1 $\mu \mathrm{A}$
- I/O and Packages
- Three Programmable I/O Lines for AT90S/LS2323
- Five Programmable I/O Lines for AT90S/LS2343
- 8-pin PDIP and SOIC
- Operating Voltages
- 4.0-6.0V for AT90S2323/AT90S2343
- 2.7-6.0V for AT90LS2323/AT90LS2343
- Speed Grades
- 0-10 MHz for AT90S2323/AT90S2343-10
- 0-4 MHz for AT90LS2323/AT90LS2343-4
- 0-1 MHz for AT90LS2343-1

## Description

## Block Diagram

The AT90S/LS2323 and AT90S/LS2343 are low-power, CMOS, 8-bit microcontrollers based on the AVR RISC architecture. By executing powerful instructions in a single clock cycle, the AT90S2323/2343 achieves throughputs approaching 1 MIPS per MHz allowing the system designer to optimize power consumption versus processing speed.

The AVR core combines a rich instruction set with 32 general-purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

Figure 1. The AT90S/LS2343 Block Diagram

Figure 2. The AT90S/LS2323 Block Diagram

The AT90S2323/2343 provides the following features: 2K bytes of In-System Programmable Flash, 128 bytes EEPROM, 128 bytes SRAM, 3 (AT90S/LS2323)/5 (AT90S/LS2343) general-purpose I/O lines, 32 general-purpose working registers, an 8bit timer/counter, internal and external interrupts, programmable Watchdog Timer with internal oscillator, an SPI serial port for Flash Memory downloading and two softwareselectable power-saving modes. The Idle mode stops the CPU while allowing the SRAM, timer/counters, SPI port and interrupt system to continue functioning. The Power-down mode saves the register contents but freezes the oscillator, disabling all other chip functions until the next interrupt or hardware reset.
The device is manufactured using Atmel's high-density nonvolatile memory technology. The On-chip Flash allows the program memory to be reprogrammed in-system through an SPI serial interface. By combining an 8-bit RISC CPU with ISP Flash on a monolithic
chip, the Atmel AT90S2323/2343 is a powerful microcontroller that provides a highly flexible and cost-effective solution to many embedded control applications.

The AT90S2323/2343 AVR is supported with a full suite of program and system development tools including: C compilers, macro assemblers, program debugger/simulators, in-circuit emulators and evaluation kits.

The AT90S/LS2323 is intended for use with external quartz crystal or ceramic resonator as the clock source. The start-up time is fuse-selectable as either 1 ms (suitable for ceramic resonator) or 16 ms (suitable for crystal). The device has three I/O pins.

The AT90S/LS2343 is intended for use with either an external clock source or the internal RC oscillator as clock source. The device has five I/O pins.

Table 1 summarizes the differences in features of the two devices.

Port B (PB2..PB0)

XTAL1

XTAL2

Supply voltage pin.
Ground pin.
Port B is a 3-bit bi-directional I/O port with internal pull-up resistors. The Port B output buffers can sink 20 mA . As inputs, Port B pins that are externally pulled low, will source current if the pull-up resistors are activated.

Port B also serves the functions of various special features.
Port pins can provide internal pull-up resistors (selected for each bit). The Port B pins are tri-stated when a reset condition becomes active.

Reset input. An external reset is generated by a low level on the $\overline{\text { RESET }}$ pin. Reset pulses longer than 50 ns will generate a reset, even if the clock is not running. Shorter pulses are not guaranteed to generate a reset.

Input to the inverting oscillator amplifier and input to the internal clock operating circuit.
Output from the inverting oscillator amplifier.

Port B is a 5-bit bi-directional I/O port with internal pull-up resistors. The Port B output buffers can sink 20 mA . As inputs, Port B pins that are externally pulled low, will source current if the pull-up resistors are activated.

Port $B$ also serves the functions of various special features.
Port pins can provide internal pull-up resistors (selected for each bit). The Port B pins are tri-stated when a reset condition becomes active.

AT90S2323/2343 Register Summary

Note: 1. For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.
2. Some of the status flags are cleared by writing a logical "1" to them. Note that the CBI and SBI instructions will operate on all bits in the I/O register, writing a one back into any flag read as set, thus clearing the flag. The CBI and SBI instructions work with registers $\$ 00$ to $\$ 1 F$ only.

Notes: 1. The speed grade refers to maximum clock rate when using an external crystal or external clock drive. The internal RC oscillator has the same nominal clock frequency for all speed grades.
2. In AT90LS2343-1xx, the internal RC oscillator is selected as default MCU clock source (RCEN fuse is programmed) when the device is shipped from Atmel. In AT90LS2343-4xx and AT90S2343-10xx, the default MCU clock source is the clock input pin (RCEN fuse is unprogrammed). The fuse settings can be changed by high voltage serial programming.
